

Capture the Flag 3: Data-Driven UI

Goal: Separate application data from the UI and handle multiple pieces of data in a usable interface.

Instructor Note

These activities require your own problem-solving and research skills.

DO NOT use AI to generate the code for you.

You may use AI to:

- Research what a Dart/Flutter feature does
- Understand syntax
- **Explain** an error (not **fix** your error)
- Clarify documentation

You may **NOT** ask AI to generate the solution/code for a flag.

🚩 Flag 0 — Create Your Feature Branch

Objective: Create a feature branch before modifying your application.

Create:

`feature/data-ui`

Screenshot:

- Terminal showing your current branch

```
admin@Mavie MINGW64 ~/Documents/Assignment/IT314A_data ui/IT314AB_TAJANLANGIT/my
_first_flutter_app (feature/widgets)
$ git checkout -b feature/data-ui
Switched to a new branch 'feature/data-ui'

admin@Mavie MINGW64 ~/Documents/Assignment/IT314A_data ui/IT314AB_TAJANLANGIT/my
_first_flutter_app (feature/data-ui)
$ git branch
bash: git: command not found

admin@Mavie MINGW64 ~/Documents/Assignment/IT314A_data ui/IT314AB_TAJANLANGIT/my
_first_flutter_app (feature/data-ui)
$ git branch
* feature/data-ui
  feature/widgets
  master
```

Flag 1 — Identify the Data

Objective: Identify the appropriate Dart data type for the information in your profile.

Research basic Dart data types and identify at least **four different types** that could be used in your application.

Examples:

String
int
double
bool

Create a table identifying the information and its appropriate data type.

Create:

- Your identified data
- The corresponding data types

Information	Data Type
Name	String
Course & Section	String
Age	Int
Hobby	String
Height	Double
Student Status	Bool
Profile Image	String

Flag 2 — Create Your Data

Objective: Create appropriately typed variables for your profile.

Create variables for at least:

- Name
- Course & Section
- Age
- Hobby
- Height
- Student status

Your data should exist **separately from your UI widgets**. (Declare variables separately from your UI, not directly inside your widgets)

Screenshot:

- Your variables
- Their data types
- Application still running

```
Relase Notes: 1.133.0 main.dart
lib > main.dart > MyApp > build
1 import 'package:flutter/material.dart';
2
3 // FLAG 2: Profile Data
4 String name = "Maverick Tajanlangit";
5 String courseSection = "BS Information Technology - 3rd Year";
6 int age = 20;
7 String hobby = "Dancing";
8 double height = 1.70;
9 bool isStudent = true;
10 String profileImage = "assets/profile.png";
11
12 void main() {
13   runApp(const MyApp());
14 }
15
```

Flag 3 — Connect Data to UI

Objective: Replace your hardcoded information with your variables.

Your profile should now display information using the variables you created.

Test:

Change the value of one of your variables.

The UI should automatically display the new value.

Screenshot:

- Variables
- Widgets displaying the variables
- Updated application

```
lib > main.dart > main
1  import 'package:flutter/material.dart';
2
3  // Profile Data
4  String name = "Maverick";
5  String courseSection = "BS Information Technology - 3rd Year";
6  int age = 20;
7  String hobby = "Dancing";
8  double height = 1.70;
9  bool isStudent = true;
10 String profileImage = "assets/profile.png";
11
```

```

69
70
71
72
73
74
75
76
Text(
  name,
  maxLines: 1,
  style: const TextStyle(
    color: Colors.black,
    fontFamily: 'serif',
    fontSize: 26,
    fontWeight: FontWeight.bold,
    fontStyle: FontStyle.italic,
  ), // TextStyle
), // Text

const SizedBox(height: 10),

// Course & Section
Text(
  courseSection,
  textAlign: TextAlign.center,
  style: const TextStyle(
    color: Colors.black,
    fontFamily: 'serif',
    fontSize: 16,
  ), // TextStyle
```

🚩 Flag 4 — Make the Image Data-Driven

Objective: Make your profile image part of your data.

Create a variable containing the path to your profile image.

Use the variable when displaying the image.

Then change the variable to another registered image.

The image displayed by the application should change.

Screenshot:

- Image variable
- Image widget using the variable
- Updated application

```
31 Profile maverick = Profile(  
32   image: "assets/profile.png",  
33   name: "Maverick Tajanlangit",  
34   course: "BS Information Technology - 3rd Year",  
35   age: 20,  
36   hobby: "Dancing",  
37   height: 1.70,  
38   isStudent: true,  
39 );
```

```
31 Profile maverick = Profile(  
32   image: "assets/profile.png",  
33   name: "Maverick Tajanlangit",  
34   course: "BS Information Technology - 3rd Year",  
35   age: 20,  
36   hobby: "Dancing",  
37   height: 1.70,  
38   isStudent: true,  
39 );
```

Flag 5 — Five Profiles, One Design

Objective: Create at least **five different profile cards** using the same visual design.

Each profile must contain at least:

- Image
- Name
- Course & Section
- Age
- Hobby

The five profiles must contain different information.

Important

All five profiles should use the **same visual design**.

You are demonstrating that the same UI can represent different data.

Screenshot:

- Your 5 different profile data

```
27 Profile maverick = Profile(  
28     image: "assets/profile.png",  
29     name: "Maverick Tajanlangit",  
30     course: "BPA - 3rd Year",  
31     age: 20,  
32     hobby: "Dancing",  
33 );  
34  
35 Profile Bryan = Profile(  
36     image: "assets/profile2.png",  
37     name: "Bryan Quino",  
38     course: "BSIT - 3rd Year",  
39     age: 21,  
40     hobby: "Gaming",  
41 );
```

```
43 Profile Leachim = Profile(  
44     image: "assets/profile3.png",  
45     name: "Leachim Dela Cerna",  
46     course: "BSN - 3rd Year",  
47     age: 22,  
48     hobby: "Clubbing",  
49 );  
50  
51 Profile Julia = Profile(  
52     image: "assets/profile4.png",  
53     name: "Julia Kong",  
54     course: "BS Biology - 3rd Year",  
55     age: 23,  
56     hobby: "Cooking",  
57 );  
58
```

```
59 Profile James = Profile(  
60     image: "assets/profile5.png",  
61     name: "James Gulfan",  
62     course: "BPED - 3rd Year",  
63     age: 24,  
64     hobby: "Playing Instruments",  
65 );
```

Flag 6 — THE HIDDEN PROBLEM

You didn't see your UI?

Objective: Make all five profiles accessible to the user.

You just added five profile cards.

Now run your application.

Something is wrong.

Look carefully at your emulator.

Can you see all five profiles?

Maybe you can see the first one...

Maybe part of the second...

But where are the rest?

That's right.

You can't see them.

Your UI is larger than the available screen.

The profiles exist.

The data exists.

The widgets exist.

But the user can't access everything.

Your Mission:

Figure out how Flutter allows users to **scroll through content that is larger than the available screen**.

Research Flutter's **scrolling widgets** and determine which one is appropriate for your current layout.

You must make it possible to scroll through all five profiles.

Requirement:

The user must be able to:

Scroll → see Profile 1 → Profile 2 → Profile 3 → Profile 4 → Profile 5

without changing the size of the screen.

Screenshot:

- The scrolling widget in your code
- Top portion of the application
- The rest of the portion of the application showing the later profiles

```
90 // =====
91 // SCROLLING WIDGET
92 // =====
93
94 body: SingleChildScrollView(
95   child: Center(
96     child: Column(
97       mainAxisAlignment: MainAxisAlignment.center,
98
99       children: [
100
101         // PROFILE 1
102         ProfileCard(
103           profile: maverick,
104         ),
105
106         const SizedBox(height: 15),
```

Flag 7 — Survive the Database

Objective: Prepare your UI for incomplete data.

Now imagine your profiles aren't manually created.

Someday, the data will come from a database.

And real data isn't always perfect.

Some information may be:

- Missing
- Empty
- `null`
- Not provided

Create at least **three profiles with missing information**.

For example:

Profile A

Name: Maria

Course: BSIT

Hobby: **missing**

Profile B

Name: Juan

Course: **missing**

Hobby: Gaming

Profile C

Name: **missing**

Course: MMA

Hobby: Drawing

Your application must **not crash** when information is missing.

Instead, provide an appropriate fallback.

Examples:

Hobby: Not provided

Course: Unknown

Challenge

Your placeholders should look intentional and clean.

Screenshot:

- Incomplete profile data
- Application displaying fallback values
- Application still functioning correctly

```
Profile maverick = Profile(  
    image: "assets/profile.png",  
    name: "Maverick Tajanlangit",  
    course: "BPA - 3rd Year",  
    age: 20,  
    hobby: "Dancing",  
);  
  
Profile Bryan = Profile(  
    image: "assets/profile2.png",  
    name: "Bryan Quino",  
    course: "BSIT - 3rd Year",  
    age: 21,  
);
```

```
Profile Leachim = Profile(  
    image: "assets/profile3.png",  
    name: "Leachim Dela Cerna",  
    age: 22,  
    hobby: "Clubbing",  
);  
  
Profile Julia = Profile(  
    image: "assets/profile4.png",  
    course: "BS Biology - 3rd Year",  
    age: 23,  
    hobby: "Cooking",  
);  
  
Profile James = Profile(  
    image: "assets/profile5.png",  
    name: "James Gulfan",  
    course: "BPEd - 3rd Year",  
    age: 24,  
    hobby: "Not provided",  
);
```

Flag 8 — Save Your Progress

Objective: Commit and push your completed Data-Driven UI CTF.

Use an appropriate commit message following proper Git standards.

Branch:

`feature/data-ui`

Screenshot:

- Successful commit
- Current branch
- Terminal showing the commit

```
admin@Mavie MINGW64 ~/Documents/Assignment/IT314A_data ui/IT314AB_TAJANLANGIT (feature/data-ui)
